

Art Glass KALEIDOSCOPES

by Bob and Grace Ade

Model Name: “ELEMENTS” **Limited Edition of 30**

Description: “ELEMENTS” has a three dimensional image simulating an array of rectangular elements wrapped into a circular configuration.

Early man recognized 4 elements: earth, air, fire and water. Science in the middle ages found that many basic elements make up our universe. Brewster discovered that objects viewed through mirrors created beautiful images made up of reflected elements. And so this kaleidoscope celebrates the combination of elements in an object cell reflected by mirrors many times into element segments joined in a curving form that makes an image which in turn becomes one element along with additional elements of the case, lens, pedestal and base to make, along with the viewer, a complete beautiful experience.

The 11” long sleek black case is kiln formed with a fused dichroic glass pattern on each side and a irridized art glass top. A solid clear glass pedestal and laminated glass base complete the parlor scope configuration. The object cell contains flame worked glass and glass beads in a rotating liquid chamber.
